

# Analysis of NFL 4th Down Decisions

Frank Tucci

# Intro

- Possibilities on 4th down:
  - Punt
  - Field Goal
  - Try for a 1st Down
- Purpose:
  - Useful for fans, reporters, sportscasters to know when a play is out of the ordinary.
  - A defensive team can know what to expect.

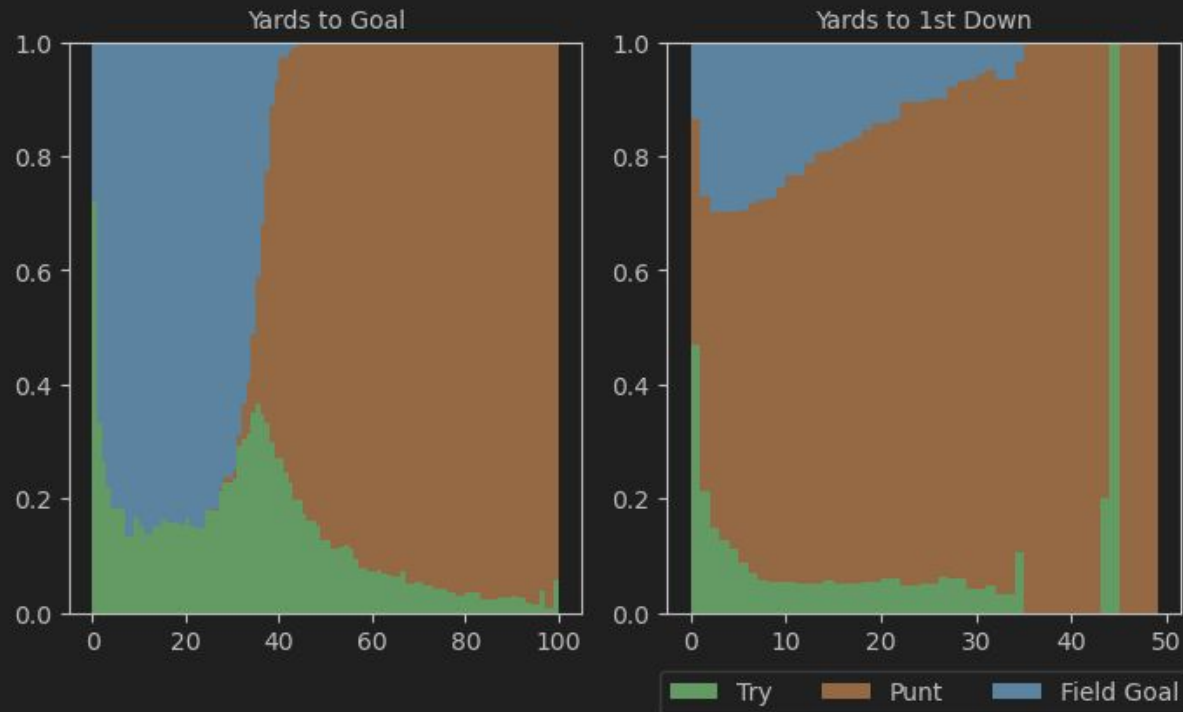

# Data

- Every NFL play from 1999-2023 from nfl\_data\_py python module
  - 1.2 million play-by-play records
  - 100,000 4th downs
- Features collected:
  - Yards to Endzone
  - Yards to 1st Down
  - Home/Away Score
  - Seconds to the End of Game
  - Weather
- 80/20 Test/Train Validation

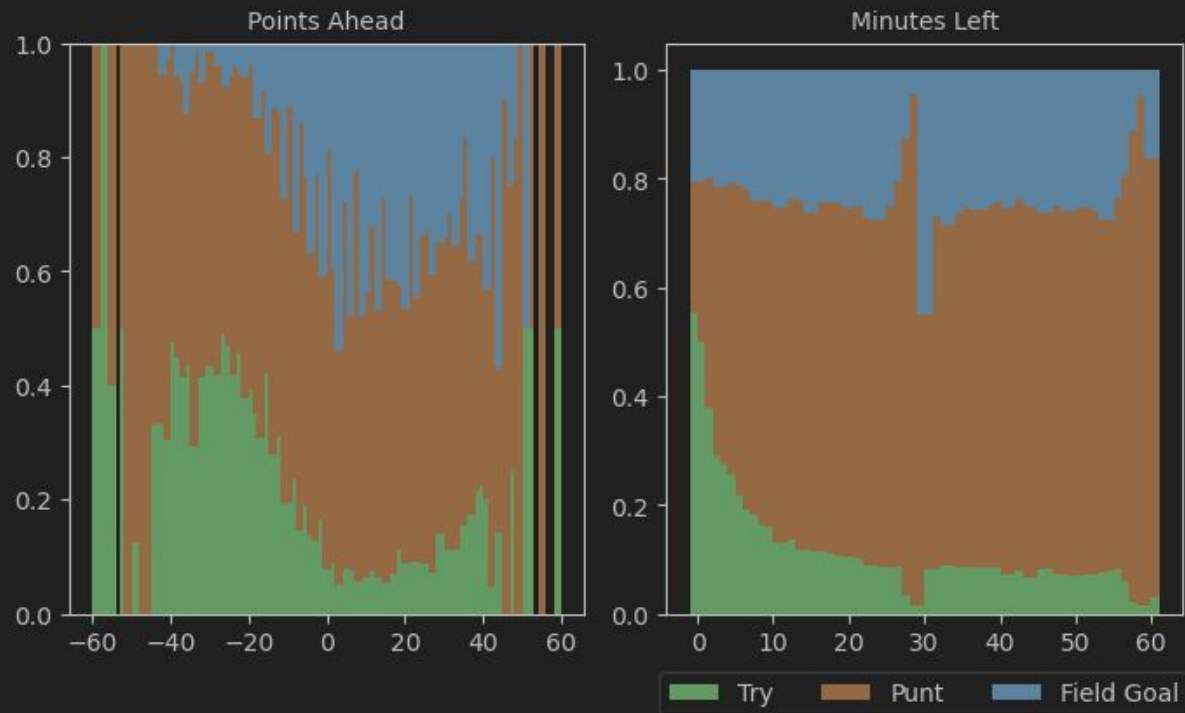

# Observations – Yardage

- Field goals are popular inside 36 yards.
- After 36 yards, punting is preferred.
- If the team only has 1 yard until the 1st down, going for it is most common.

# Observations – Point Spread and Time

- A losing team will likely try for 1st down (higher risk/reward).
- A winning team will instead go for a field goal.
- Trying for 1st is most common at the end of the game.

# Observations – Weather

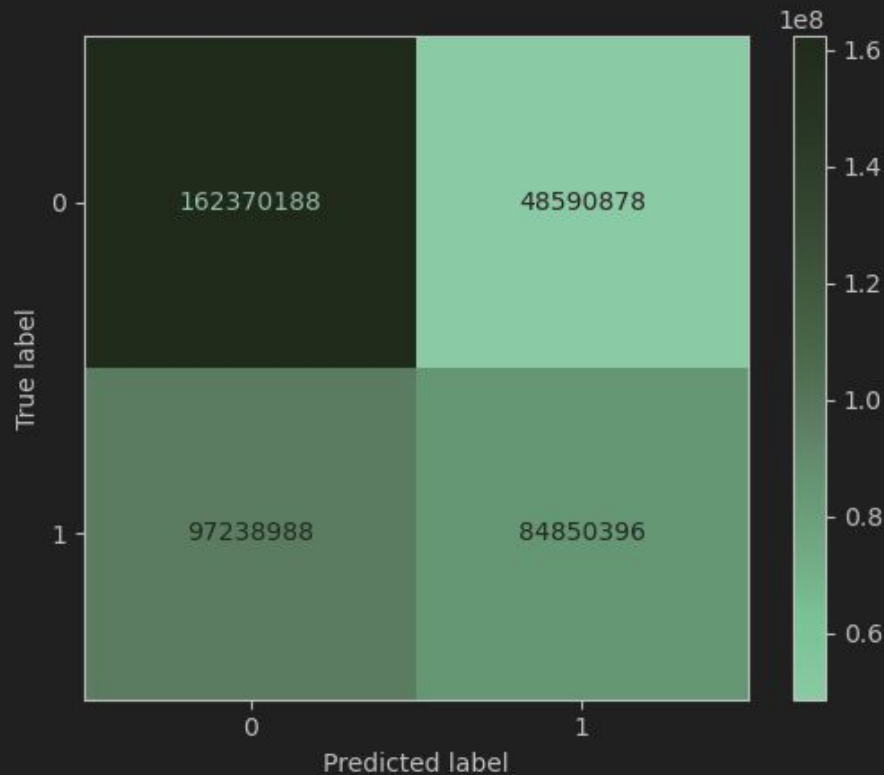

- Weather is not statistically significant and will be ignored.

# K Means Clustering

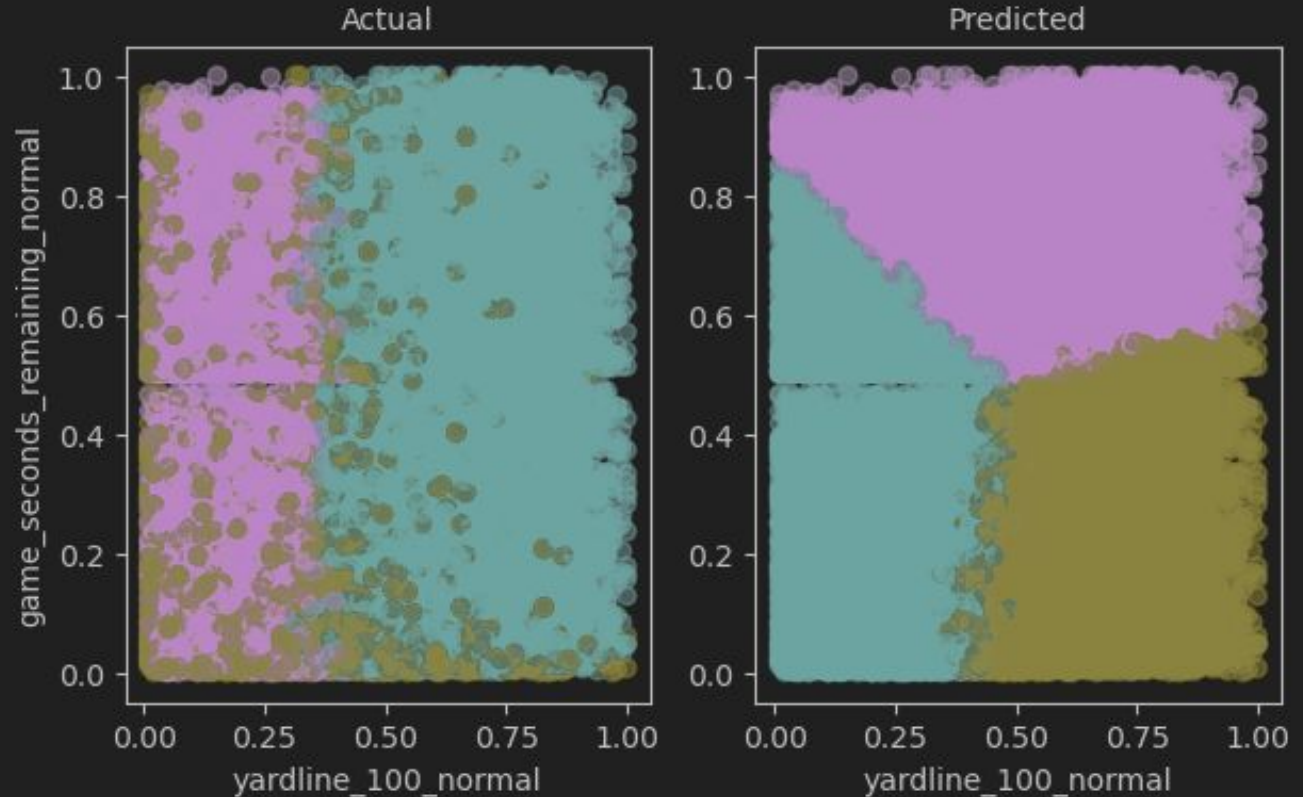

- Didn't work very well
  - Target categories are different sizes and are too overlapping.

Precision	0.80
Recall	0.65
F1	0.72

# The Problem with K Means Clustering

- Field Goals: 4729
- Punts: 12355
- 1st Down Tries: 2742

# K Nearest Neighbor

- K selection:
  - Found error term lowest around  $k = \sim 20$

# K Nearest Neighbor

- Worked Significantly Better than K Means

Accuracy	0.91
Precision	0.88
Recall	0.93
F1	0.90

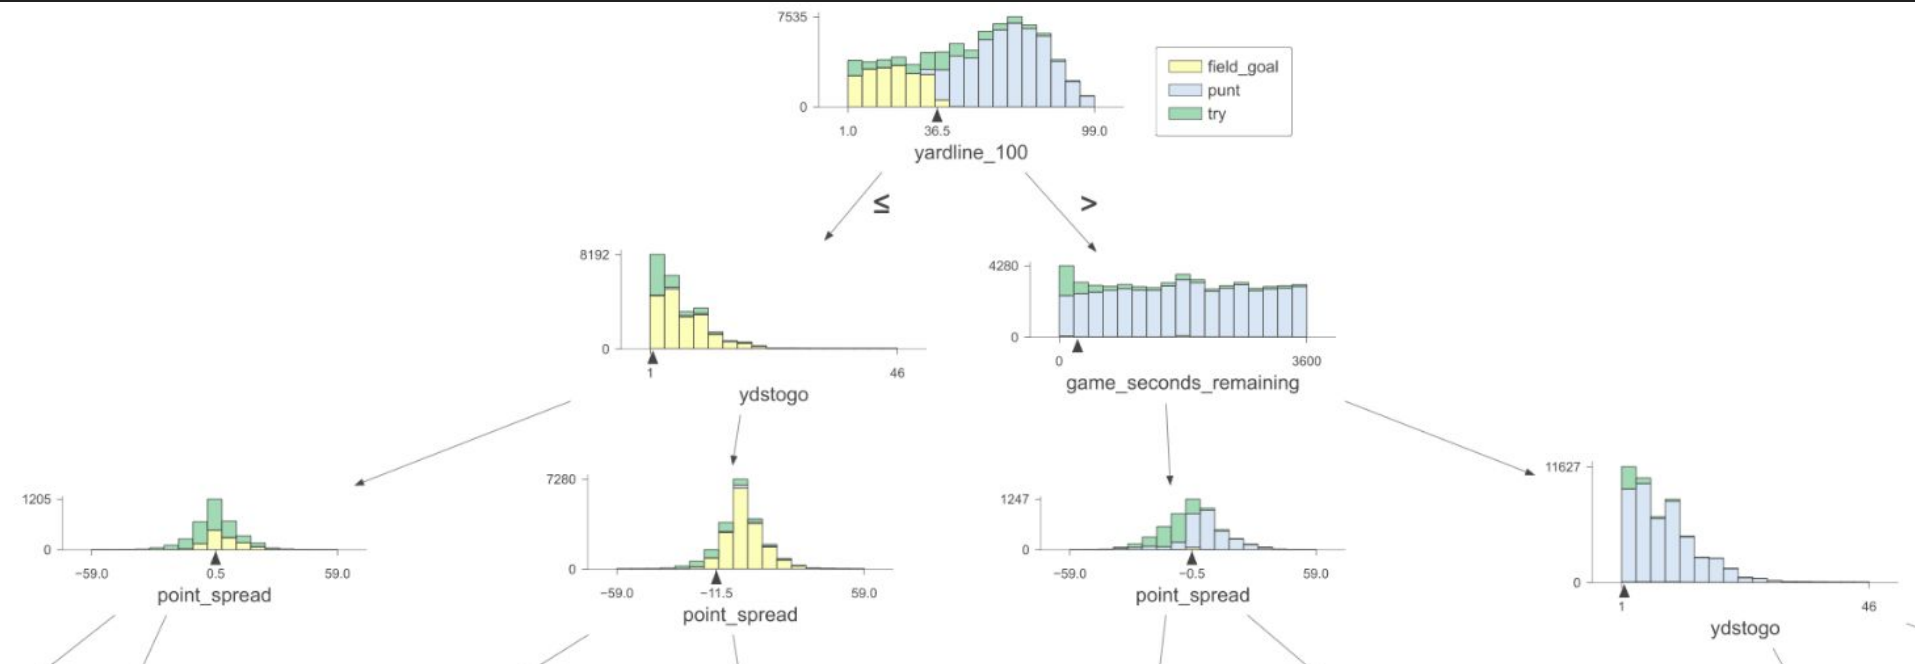

# Decision Tree

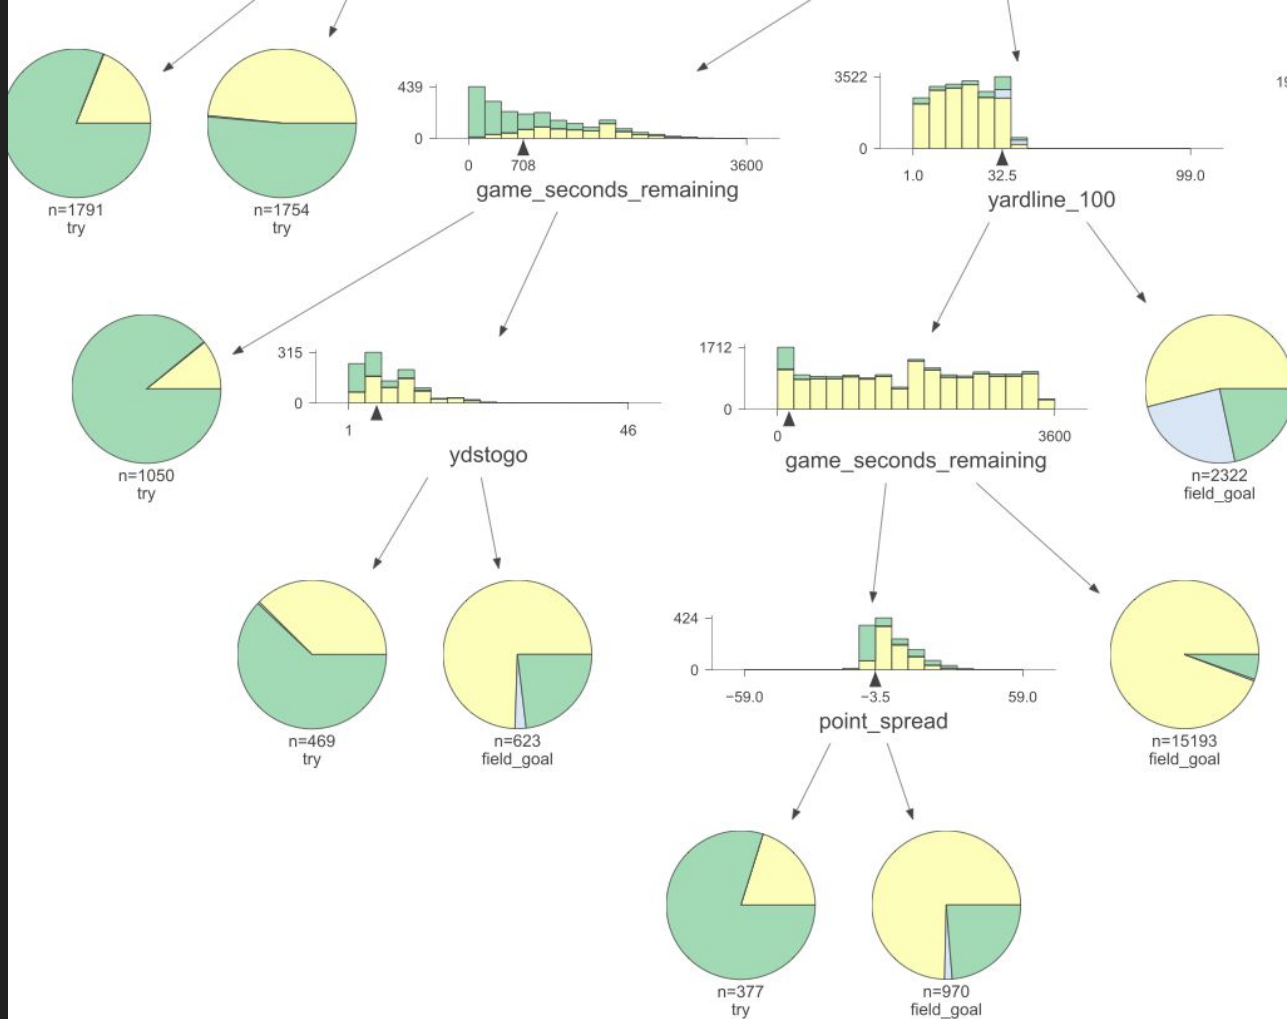

- Similar results as K Means
  - 25 leaf node maximum
  - Better at categorizing tries, the smallest target category

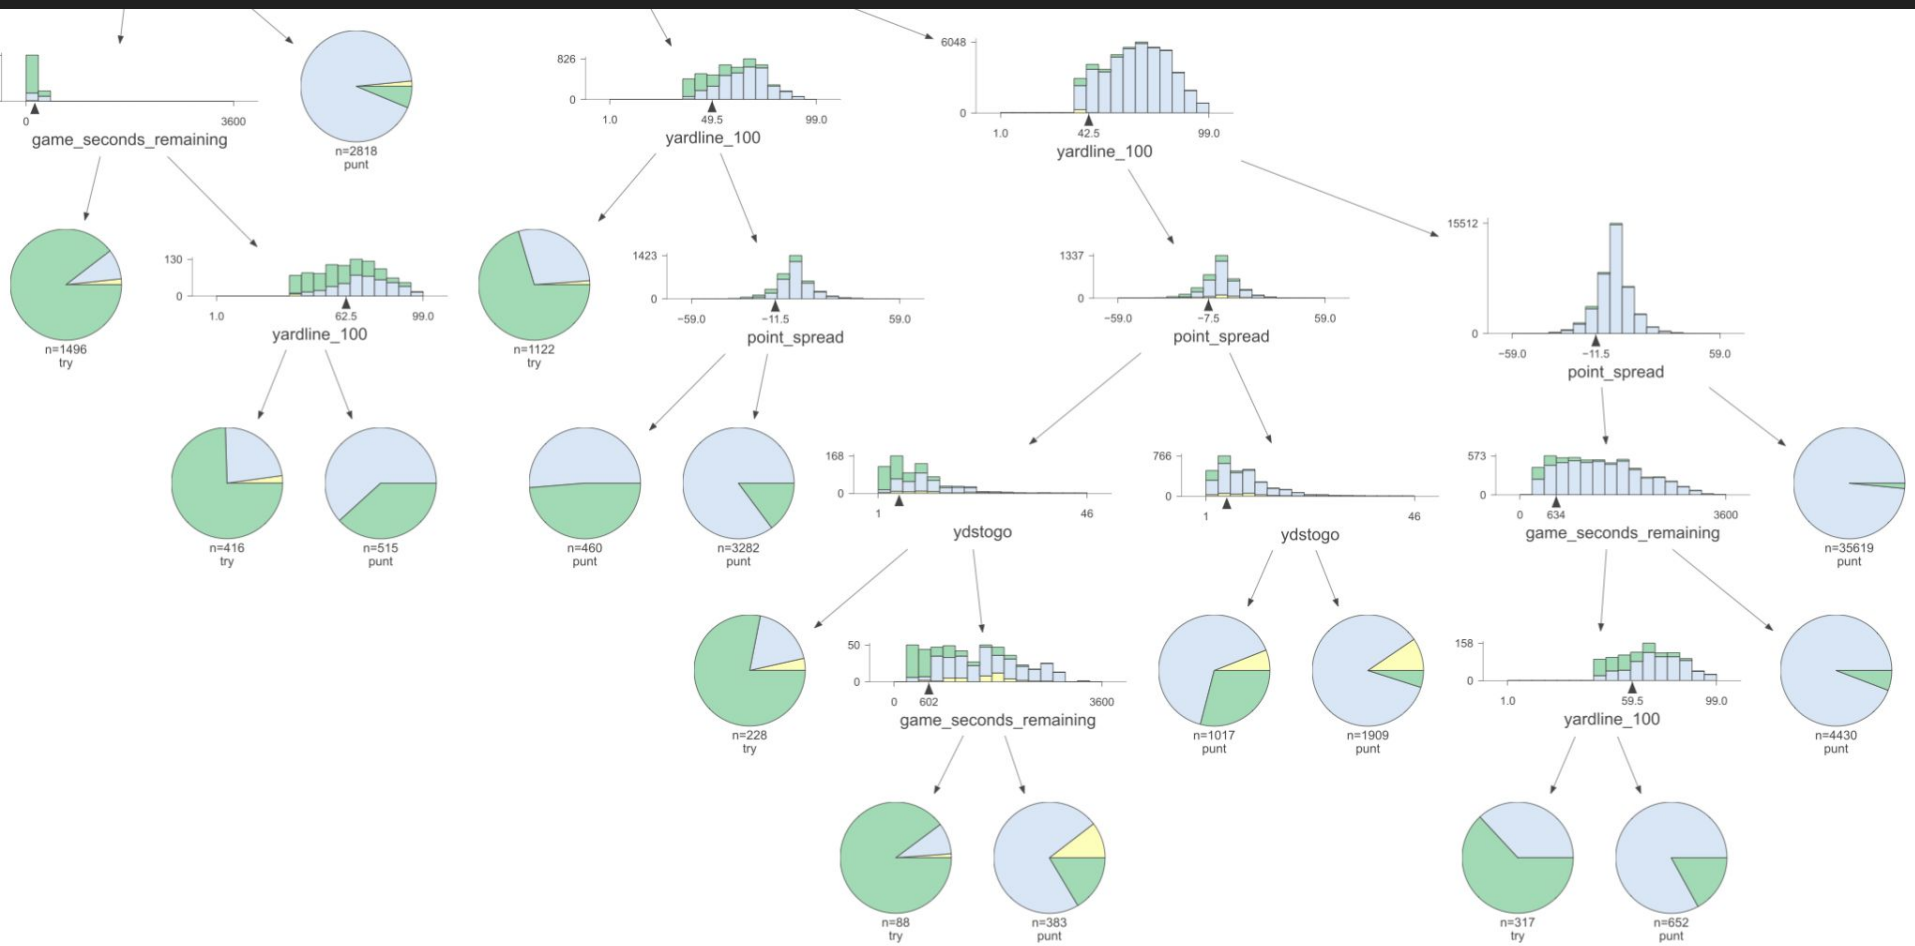

Accuracy	0.90
Precision	0.88
Recall	0.91
F1	0.90

# Decision Tree Visualizer

# Conclusions

- Decision tree visualization gave insight *beyond* looking at any feature individually.
- Distance to the end zone is the most influential factor:
  - Having minimal yards to 1st down, or being behind by more than a field goal near the end of the game are two factors that push teams to try for 1st down.
- Hard to get much higher than 90% accuracy:
  - More analysis could be done looking at individual player and/or coach playstyles.
  - There is still an element of randomness involved.
